US State selects leading email and file encryption solution to cater for an on-premise and hosted Microsoft Office 365 environment.

Following Cisco's announcement to end-of-life IEA, forward-thinking State of Delaware identified the need for a replacement solution that could cater for a mixed environment of on-premise Microsoft Exchange for state side users and Office 365 for K12 educational users.

The Switch solution helps Delaware meet this need by delivering a combination of encryption services designed to complement their hybrid environment. Once deployed, Switch will enable State and K12 Education users to leverage single sign-on through Active Directory Federation Services (ADFS) when accessing and sharing confidential information via email, using desktop, mobile, or web based applications, without changing end user behavior.

US State of Delaware selects Egress Switch to replace Cisco IronPort email encryption

Egress Software Technologies Inc., a leader in encryption services, announces that US State of Delaware is replacing its email and file encryption solution, Cisco IronPort Encryption Appliance (IEA), with Egress Switch. Following Cisco's announcement to end-of-life IEA, forward-thinking State of Delaware identified the need for a replacement solution that could cater for a mixed environment of on-premise Microsoft Exchange for state side users and Office 365 for K12 educational users.

The Switch solution helps Delaware meet this need by delivering a combination of encryption services designed to complement their hybrid environment. Once deployed, Switch will enable State and K12 Education users to leverage single sign-on through Active Directory Federation Services (ADFS) when accessing and sharing confidential information via email, using desktop, mobile, or web based applications, without changing end user behavior.

About Egress Software Technologies

Egress Software Technologies Inc. is the leading provider of hosted and on-premise encryption services, designed to secure all forms of electronic information and delivered to customers in the Public and Private Sectors using a single platform: Egress Switch.

Switch utilizes AES 256-bit FIPS 140-2 approved encryption in order to provide the highest level of security for complete end to end data exchange. In the U.S., Switch helps organizations remain compliant with industry and government standards and regulations designed to safe guard sensitive consumer data, including HIPAA and the GLBA.

The award-winning Switch portfolio of products includes Secure Email, Secure File Transfer, Secure Web Form and the latest online collaboration offering, Secure Workspace. Using patented key management, the platform utilizes a unique community-based licensing model known as 'the Egress Trust Network' that consists of paying and free Switch subscribers, who are able share information securely with one another using a single global identity.
